

**METHOD, APPARATUS AND COMPUTER PROGRAM PRODUCT FOR
CONTEXT-SENSITIVE SCROLLING**

ABSTRACT

5

A window is generated for displaying information and for scrolling through the information responsive to receiving a scrolling command. Responsive to a user selection, either a non-context-sensitive scrolling mode is enabled, for which a certain one of the scrolling commands scrolls the window by a fixed step size, or a context-sensitive scrolling mode is enabled, for which the same certain one of the scrolling commands scrolls the window by a variable step size responsive to content of the information displayed. In a current position of the window a certain object is top-most in the window. With context-sensitive scrolling enabled, if the end of the top-most object is shown in the current position scrolling steps the window to a next position where a next portion of the information is displayed beginning at the top of a next object after the current top-most object.
